Homework 1 Problem 4 Discussion

Dataset Used:

<https://www.kaggle.com/datasets/navjotkaushal/coffee-sales-dataset?resource=download>

The dataset used for this assignment is from Kaggle and is named “StackOverflow Questions Count Time Series”. Stack Overflow is a popular question answers website for programmers of any experience. All questions asked and feedback given are by users where each answer can be upvoted by other people. When a user posts a question related to the programming language on Stack Overflow, a library is most likely imported. The listed dataset above "Consist of various columns containing names of libraries and the rows having the count of questions in StackOverflow for each month from 2009” to 2017.

The two datatypes chosen to be analyzed were the date and the number of times the library Matlab was imported within python on that chosen date. When plotted, the relationship between both values seems to be parabolic where the number of times Matlab is imported starts to increase in the year of 2009, peak in 2015, and decline until 2020. The trend seen by these two data types leads to two different scenarios. The first is that programmers have started to not use Matlab and use a different library in order to accomplish their goals. The other scenario is that some external factor, such as the rise of artificial intelligence, caused the website to become obsolete due to AI being such a good tool at solving problems without the help of professionals.
